Plasmid pITL-hHER2/neu comprises base vector pITL (see AAV21724) and a human HER2/neu nucleic sequence. pITL-hHER2/neu was used to evaluate the toxicity of anti-tumour vaccination in rats, and in phase I and phase II trials to evaluate polynucleotide vaccination in advanced breast cancer. Novel humanised vectors, which can be based on pITL, comprise a human-darived promoter or mammalian homologue which is functional in mammalian target tissue and cells
                                                                                                                                                                                                                                                          comprising human derived promoter
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              and a sequence acceptance site which accepts cDNA products from RT-PCR cloning. The vectors are non-replicating in mammalian cells but are capable of extended stable expression of the target
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      sequence, generating an immune response in immunised individuals. The vectors selectively elicit immune responses to the target sequences with little or no immune response to the other component
                                                                                                                                                                                                                                                                              the production of vaccines
                                                                                                                                                SERVICES
                                                                                                                                                                                                                                                                          and sequence acceptance site, used for
                                                                                                                                                                                                                                                                                                              Example 7; Page 41-42; 125pp; English.

polynucleotide vectors. Such vector for novel humanised
polynucleotide vectors. Such vectors comprise a human-derived
promoter or mammalian homologue which is functional in mammalian
target tissue and cells and a sequence acceptance site (see
AAV21735-36), which accepts CDNA products from RT-PCR cloning. They
also contain minimal non-human components, such as a replication
or righn (see AAV21715) and selectable marker gene (see AAV21717-18) that
are necessary for production of the vector, as well as human-derived
corigin (see AAV21715). The novel vectors are
used to express target antigens, especially tumour antigens.
they
are non-replicating in mammalian cells but are capable of extended
stable expression of target sequences generating an immune response
to inmunised individuals. The vectors selectively elicit immune
responses to the target sequences with little or no immune response
to the other components of the vectors. The target antigens are
content of a sintracellular polypeptides or peptides and, as such,
are processed as self polypeptides or peptides and appropriately
presented on antigen presenting cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              1101

plasmid pITL-GFP comprises base vector pITL (see AAV21724) and a humanised green fluorescent protein (GFP) reporter sequence can humanised dreen fluorescent protein (GFP) reporter sequence can mammalian homologue which is functional in mammalian target tissue and cells and a sequence acceptance site which carcepts cDNA products from RT-PGF cloning. PITL-GFP was used to examine the kinetics of expression of a reporter sequence from such vectors in an animal model (Fisher 344 rats). Toxicity from such vectors in an animal model (Fisher 344 rats). Toxicity from such vectors in an animal model (Fisher 344 rats). Toxicity from such vectors target antiqens, especially tumour antiques. They are non-replicating in mammalian cells but are capable of extended is target sequences generating an immune response in immunised individuals. The vectors selectively elicit immune response to the target sequences with little or no immune response to the other components of the vectors. The target antigens are expressed as intracellular polypeptides or peptides and, as such, are processed as self polypeptides or peptides and appropriately presented on antigen presenting cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            989 AGCCCCCGGGCAGCACAGGCCAATGCCCGTCCTTCCCCTGCAGTGAGTAGTGACTGCCCG 1048

```

This is the human HER-2 polynucleotide sequence. The HER-2 gene also called crneu and ErbB2, encodes a transmembrane receptor, with tyrosine kinase activity. HER-2 is related to the epidermal growth factor receptor (EGFR or HER-1). Aberrant HER-2 expression is present in a wide number of cancers, especially breast, ovarian and gastric cancers. This sequence is used in the invention to design 12-25 nucleotide

```
oligonucleotides that decrease the expression of human HER-2. The oligonucleotides of the invention (AAZ31067-Z31070) can also be used for modulating the expression of human epidermal growth factor receptor. The oligonucleotides are used to treat diseases or conditions associated with HER-2, particularly hyperproliferative diseases ann as associated with

                                                                                                                                                                                                                                                                                                               Treating tumors, particularly breast cancers, which overexpress an ErbB receptor and does not respond to an anti-ErbB antibody, comprises conjugating the antibody to a maytansinoid -
                                                                                                                                                                                                                                                                                                                                                                                      The present invention provides a method of treating cancer by administering a conjugate of anti-ErbB antibody with a maytansinoid. In particular, the antibody is directed against ErbB2 (also known as HER2 and p185neu). The method is particularly useful in the treatment of breast, ovarian, stomach, endometrial, salivary gland, lung, kidney, colon, colorectal, thyroid, pancreatic, prostate and bladder cancers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 5164

HPBF (see AAR77093-94), the Erb-B2 promoter binding protein, induces cell division on binding to the promoter. In a method for greater success in early identification and treatment of breast cancer, the initation step for Erb-B2 gene activity is identified. This method involves determining the presence of HPBF in a biopsy from the subject, where the presence of HPBF (relative to its absence in a normal control) indicates the presence of cancer and

This sequence represents the human HBR2 cognate transgene (CTG).
Deletion of amino acids 1-731 of the encoded protein renders the CTG
non-transforming. HBR2 is a tyrosine kinase-type receptor. This sequence can be used in the cellular immunogen of the invention. The cellular immunogen of the invention is for immunishing against the product of a target proto-oncogene, over-expression of which is associated with a cancer, comprises host cells transfected with a construct containing at promoter. The product of the transgene induces immunoracityity to host promoter. The product of the transgene induces immunoracityity to host self-determinants on the product of proto-oncogene. The cellular immunogens are used for protective vaccination against cancer (e.g. carcinoma of breast or colon, or various lymphomas) and for immunotherapy of cancer. Use of the immunogen liminates the need to isolate immunogenic, HLA host-matched peptides. The method is not based on immune reconstruction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ij

product of a target proto-oncogene which is associated with a malignanacy. The cellular immunogen comprises allogenic cells transfected with transgene construct comprising a transgene cognate to target proto-oncogene and a strong promoter. The cellular immunogen is useful for vaccinating a host against cancer by inserting the transgene construct into the body of the host for the expression of the transgene. The method of the invention is designed to target mutation-driven non-self determinants. The cellular immunogens induce reactivity for self-determinants in the over expressed product of tumour associated and over expressed proto-oncogenes.

The protein has an in-frame deletion of 16 amino acids, 2 of which are conserved cysteine residues, compared to the unspliced protein. The conserved cysteine residues, compared to the unspliced protein. The crbB-2 polynucleotide is used to construct probes for detecting disorders of cell transformation such as cancer. Antibodies to the protein may be used to detect SPLICE erbB-2 in a sample. Agents (e.g. antisense oligonucleotides) which inhibit the expression of treating cancer. Substances which stimulate SPLICE erbB-2 are useful for reducing tumor cell proliferation and for treating conditions involving damaged cells including conditions. Involving damaged cells including conditions in which degeneration of tissue occurs, such as arthropathy, bone resorption, inflammatory diseases, degenerative disorders of the
                                                                                                                SPLICE erbB-2 receptor protein; cell transformation disorder; cancer; tumor cell proliferation; tissue degeneration; arthropathy; bone resorption; inflammatory disease; degenerative disorder;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Nucleic acid encoding an erbB 2 receptor protein designated SPLICE erbB-2, inhibitors of the protein are useful for treatment of cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         3249 acccagcagggettettetgtecagaceetgeecegggegetggggggggtgggeegea 3308

                                                                                                                                                                                                                                                                                                                                                                 1;
                                                                                                                          c-erbB2) protein (AAMOIII). The oncogene is overexpressed in various cancers, including breast, ovarian, colon, lung and prostate, and appears to induce malignancies through quantitative mechanisms that result from increased or deregulated expression of an essentially normal gene product. Nucleotides 2026-3765 of the CDNA sequence code for the intracellular domain (Lys676-Vall255) of the HER-2/neu protein, which is useful for immunisation against malignancy.

Nucleic acids can be used to direct expression of the intracellular domain in transformed host cells, or are used, alone or in a viral vector, for genetic immunisation of an animal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          3494

```
This sequence encodes the human HER-2/neu oncogene protein. A fragment of this protein is used in a method for eliciting or enhancing an immune response to HER-2/neu protein. The polypeptide can stimulate T cells and B cells to produce an immune response to the HER-2/neu protein. The method can be used for immunisation against a mailgnancy in which the HER-2/neu oncogene is associated and in the treatment of an existing tumour, or to prevent tumour occurrence or reoccurrence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               3075 accccagcagggcttcttctgtccagaccctgccccgggcgctggggggatggtccacca 3134

The invention provides an isolated antigen-presenting cell, which expresses at least an immunogenic portion of a polypeptide that produces an immune response to HER-2/neu protein. The antigen-presenting cells are useful as vaccines for eliciting or enhancing an immune response to HER-2/neu protein, particularly in treating or preventing malignancies in which the HER-2/neu oncogene is associated. Specifically, these are useful for treating or preventing cancer, e.g. breast cancer, ovarian, colon, lung or prostate cancers. The present sequence represents a DNA encoding the human HER-2/neu protein (also known as pl85 or c-erbb2).
                                                                                                                                                                                                                                                                                                                                                    ï
                                                                  enhancing an immune response to HER-2/neu protein, particularly useful for treating or preventing cancer, e.g. breast cancer

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The claims detail a method for inducing immune responses against weakly immunogenic cell-associated peptide antigens (PA) such as those associated with cancers (i.e. self-proteins), for example, human prostate specific membrane antigen (PSM), hereguin 2 (Her2) and/or fibroblast growth factor 8b (FGF8b). The method comprises effecting simultaneous presentation by antigen producing cells (APCS) of the animals immune system of: (i) at least 1 CTL (cytotoxic T-lymphocyte) group derived from the PA and/or at least 1 B-cell group derived from the cell-associated PA; and (2) at least 1 B-cell group derived from the human/murine FGF8b comprising a substantial part of all known and predicted CTL and B-cell epitopes of the respective PA and including at least one foreign T helper epitope are also claimed. The method is used to treat prostate, prostate/preast or breast cancer when the PA is human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   3075 accccagcagggcttcttctgtccagaccctgccccggggcgctggggggatggtccacca 3134

The present sequence encodes the mouse Her-2/neu protein. Her-2/neu is a member of the tyrosine kinase family of receptor-like glycoproteins and shows homology to the epidermal growth factor receptor (EGFR). It probably plays a part in cell growth and/or differentiation. The Her-2/neu gene is an oncogene. An Her-2/neu fusion protein comprising a domain may be used to treat or prevent cancer by eliciting or enhancing an immune response to the Her-2/neu protein. It may be used to treat malignancies such as breast, ovarian, colon, lung and prostate cancers, and may be used as an antigen to vaccinate against
for vaccinating against breast, ovarian, colon, lung and

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
